Statistics: Mean 33.381; Variance 171.697; scale 0.194

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     밁
                                                                                                                                                 DRA encoding proteins which can be incorporated with wild type or nucleocapsid subunit(s) into a viral nucleocapsid - useful for protein in the isence of viral replication, especially hepatitis B virus protein in the isence of high levels of HBV replication is inhibited in the isence of high levels of HBV precore or precore-related proteins. These proteins can be incorporated into HBV nucleocapsid along with the p21 core protein (see W50251), which is the usual nucleocapsid component, and thereby render the nucleocapsid deficient in encapsidating HBV precore of HBV replication. Suitable corpression of the precore proteins, or certain variants of them, corpression of the precore proteins, or certain variants of them, corpression of the precore proteins, or certain variants of them, corpression of the precore proteins and thereby replication. Suitable combinant inhibition of HBV replication. Suitable combinant proteins include p25, p22 (see W50241), Met-p18 (see W50237) and wet-p18 Het core combinant methods using claimed expression vectors and host crecombinant methods using claimed expression vectors and host construct that directs overexpression of an inhibitory protein in construct that directs overexpression of an inhibitory protein in construct that directs overexpression of HBV infection.
                                                                         Matches
                                                                                         Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        PT DNA encoding proteins which can be incorporated with wild type
PT nucleocapsid subunit(s) into a viral nucleocapsid - useful for
PT inhibition of viral replication, especially hepatitis B virus
PS Claim 9; Page 34-55; 6(pp; English.

CC protein that is produced by elimination of the 19-amino acid leader
CC protein that 25 kDa full-length HBV precore protein (see
CC w50250). Evidence is provided that HBV precore protein (see
CC proteins. These proteins can be incorporated into HBV nucleocapsids
CC along with the p21 core protein (see W50251), which is the usual
CC nucleocapsid component, and thereby render the nucleocapsids
CC along with the p21 core proteins (see W50251), which is the usual
CC nucleocapsid component, and thereby render the nucleocapsids
CC expression of the precore proteins, or certain variants of them,
CC expression of the proteins of HBV pregnomic RNA. Thus, over-
CC expression of the proteins of HBV preplication. Suitable
CC inhibitory proteins include p25 (see W50250), p22, Met-p22 (see
CC w50242) p18 (see W50236), Met-p18 (see W50237) and Met-p18-Het
CC (see W50238). Heterologous peptides (see W50237) and Met-p18-Het
CC (see W50238). Heterologous peptides (see W50244-49) may be
clisserted into the p22 and Met-p25 polypeptides. The inhibitory
CC proteins can be produced by recombinant methods using claimed
construct that directs overexpression
CC Alternatively, a nucleic acid construct that directs overexpression
CC of an inhibitory protein in target cells is used for the gene
           SULT

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       prinhibition of viral replication, especially hepatitis B virus
prinhibition of viral replication, especially hepatitis B virus
CC This is the 21 kDa (p21) protein of hepatitis B virus (HBV) that
CC assembled into a 180 kSa subunit nucleocapsid structure that
promotes viral replication. Fridence is provided that HBV
CC replication is inhibited in the presence of high levels of HBV
CC replication is inhibited in the presence of high levels of HBV
CC replication is inhibited in the presence of high levels of HBV
CC incorporated into HBV nucleocapsids deficient in encapsidating HBV
CC incorporated into HBV nucleocapsids deficient in encapsidating HBV
CC replication. Suitable inhibitory proteins include p25 (see
CC replication. Suitable inhibitory proteins include p25 (see
CC replication. Suitable inhibitory proteins include p25 (see
CC w50350), p22 (see w50241), Met-p22 (see w50242), p18 (see w50235),
CC can be produced by recombinant methods using claimed expression
CC can be produced by recombinant methods using claimed expression
CC cells for use in inhibiting HBV replication. Alternatively, a
CC culcic acid construct that directs overexpression of an inhibitory
CC protein in target cells is used for the gene therapy of HBV
CC consecuence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Query Ma

Alteration of the C-terminus of the core protein (W09044) of hepatitis B virus (HBV) or other hepadnavirus creates a mutant polypeptide capable of reducing replication of the wild-type virus of dominant negative mechanism. The inhibitory effect is species-specific and is achieved by deletion of a few C-terminal amino acids from the core protein, and/or by joining the core protein to a hepadnavirus surface protein (see also W09045), creating a core-surface fusion. Such mutant polypeptides (see also W09046-50) can be used to treat hepadnavirus, e.g. HBV,

                                                                                         Recombinant DNA coding for polypeptide - have specificity of hepatitis B viral antigens in detection or antibody stimulation Example; Figs 3-4; 43pp; English.

Human serum from a single HBsAg positive, HBeAg positive donor (serotype adym) was used to prep. a DNA-contg. pellet which was labelled with 3H or 32P as described by P. M. Kaplan et al (1973). The labelled DNA was then extracted with phenol from the resulting pellet using the procedure of L. I. Lutwick and W. S. Robinson (1977). It was then cloned in plasmid pBR322 which was used to transform E. coli. Micro-organisms prepd. by the processes are deposited at the NCIB as pBR322-HBY-G-L, e.g. E. coli HB101/pBR322-PSt I dG: HBY-Kpn I dC: Tetr AmpS HBY+.

                                                                                                                                                                                                            plasmid phBv DN AA carries an insert (T49598) coding for a prot (W09048) comprising a hepatitis B virus (HBV) core protein (see also W09049) at amino acid 179 with the HBV surf protein (see also W09045) at amino acid 8. Plasmid phBv DN BB (T49599) expresses the HBV core fused at amino acid 175 to the surface protein at amino acid 112 (W09049). HBV DN AA was at least as potent an inhibitor of HBV replication as construct pHBV DN (T49597); phBV DN BB was less inhibitory than pHBV DN.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Plasmid pHBV DN AA encoded HBV dominant negative polypeptide. Hepadnavirus; woodchuck hepatitis virus; hepatitis delta viru HBV; ground squirrel hepatitis B virus; duck hepatitis B virus core protein; replication; antiviral; gene therapy; pHBV DN A Hepatitis B virus.
                                                                                                                                                                                                                                                                                                                                        N-PSDB; T49598.

New method for inhibiting the replication of hepadnaviruses comprises introducing a mutant polypeptide with a mutated core protein or corresponding nucleic acid, for treating, e.g. hepatitis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             T 10

Human serum from a single HBsAg positive, HBeAg positive donor (serotype adym) was used to prep. a DNA-contg, pellet which was labelled with 3H or 32P as described by P. M. Kaplan et al (1973). The labelled DNA was then extracted with phenol from the resulting pellet using the procedure of L. I. Lutwick and W. S. Robinson (1977). It was then cloned in plasmid pBR322 which was used to transform E. coli. Micro-organisms prepd. by the processes are deposited at the NCIB as pBR322-HBV-G-L, e.g. E. coli HB101/pBR322-Pst I dG:

Disclosure; Fig 7; 12pp; Japanese.

The hepatitis B core gene is recombined with PV-1 DNA and IL-1 beta to form a plasmid (Q47738) which is then used to a vaccine. NB: Sequence is difficult to read in the original

DNA used in prevention of infections by hepatitis virus B -
comprises structural gene of hepatitis virus adr B surface antigen
coding gene and at least 1 virus core antigen structural gene.
Disclosure; Fig 3; 13pp; Japanese.

The sequence is that of hepatitis virus core antigen (HBcAg). It
can be used as a vaccine for the prevention of infections by
hepatitis B virus (HBV) and also in the diagnosis of early stages
of HBV infection. See also P40310.

The hepatitis B core gene is recombined with PV-1 DNA
and IL-1 beta to form a plasmid (Q47738) which is then used to produce
a vaccine. NB: Sequence is difficult to read in the original
specification.

MPsrch_pp protein - protein database search, using Smith-Waterman algorithm

Tabular output not generated. Run on: Thu Dec 16 13:23:59 1999; MasPar time 13.87 Seconds 803.274 Million cell updates/sec

Title:

Description: Perfect Score: Sequence:

>US3869-29-38183 (1-278) from us3869-29-38183.pep 2088 1 MDIDPYKEFGATVELLSFLP......RRRRSQSPRRRRSQSRESQC 278

Scoring table: PAM 150 Gap 11

Searched:

122810 seqs, 40068593 residues

Post-processing: Minimum Match 0% Listing first 45 summaries

Database:

pir60 1:pir1 2:pir2 3:pir3 4:pir4

Statistics: Mean 46.997; Variance 115.318; scale 0.408

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
